EROS AND EDUCATION: A DISCUSSION OF ONE ASPECT OF DISCUSSION

*Joseph J. Schwab**

I
DISCUSSION, by itself, does not constitute an education. There are many things it cannot do or cannot do well. It cannot teach the whole art of reading well. It cannot do much toward teaching a student to write with clarity and to the point. It cannot efficiently give one the statements of fact or the experience with concrete things which knowledge and wisdom must sooner or later include. It cannot substitute for the solitary labor of organization and memory which underlies knowledge. Nor is it the place for the work of lonely creation which crowns knowledge if one is lucky.

Yet discussion in one form or another—with others or with one's self—is indispensable to a good liberal education. For in the last analysis, discussion is not merely a device, one of several possible means by which a mind may be brought to understanding of a worthy object. It is also the *experience* of moving toward and possessing understanding, and a liberal education is concerned with the arts and skills of understanding.

This is not to say that a liberal curriculum in which discussion has an indispensable place is *not* concerned with specific understandings of specific objects, knowledge which is useful and desirable in itself or for the sake of its applica-

tion. It is. But it is also concerned with such objects as termini of processes of intellectual activity, desirable because they mark the successful traverse, originally by a scholar or a researcher and now by a student, of a pathway toward understanding. In a curriculum concerned primarily with specific understandings of specific objects, discussion as a device of instruction may be defended as a peculiarly powerful teaching instrument, in view of the depth of understanding and the greater degree of retention which characterizes the knowledge it imparts, but it cannot be maintained that for a curriculum so oriented discussion is indispensable. It is merely one of several usable techniques; the question is one of better-or-worse which must be settled in terms of greater and lesser costliness.

In a curriculum, however, which aims to impart intellectual arts and skills and habits and attitudes, as well as bodies of information, discussion is not simply efficient or powerful but indispensable, for the same reason that the act of swimming is indispensable to teaching that art and practice on the piano indispensable to learning that. Discussion is an engagement in and a practice of the activities of thought and communication.

The idea of the "intellectual skills" and the notion of the "liberal arts" are peculiarly liable to misinterpretation. "Intellectual" is likely to evoke an image of large eyes behind horn-rimmed glasses, of arms too thin and voice too rich. Or, again, the eyes behind the lenses may be alertly malicious rather than innocent, and the mouth shaped to smile at the

* Mr. Schwab is William Rainey Harper Professor of the Natural Sciences in the College and Professor of Education at the University of Chicago. This article is a condensation of the first chapter of a book on liberal education which Mr. Schwab hopes to have ready for publication in 1955.

coarse antics of the human monkeys on the other side of the pale. There is truth in these fantasies. No greater injury has been done the intellectual than by some of his proponents. In the upper reaches of American education, some teachers have misconceived the intellectual as standing in contrariety to the physical and material and upon this misconception have built courses and coteries which encouraged in students already partially isolated from reality contempt for the concrete, the impulsive, and the earthy. In the face of these and similar consequences, it is no wonder that some of us have grown uncompromisingly suspicious, if not of the intellect, at least of people who talk about it apart from other aspects of human kind.

Our suspicions are well founded. There are neither biological, psychological, nor philosophic grounds for isolation of the intellectual as a principle of education. It is indissolubly a *part* of the learning organism.

In this view the "intellectual" is conceived as excluding the material and physical. Another view sets the intellectual apart by treating it as excluding the aesthetic and practical, and, in this form, isolation of the intellectual is frequent enough in our literature and our schools to have produced a general and regretably mistaken notion of the intellectual. Relative to the practical, the intellectual is often taken as a flight to a world of "pure" ideas and to speculation unresponsive to physical things and events. To be intellectual seems to mean in this context to know all about "Constitutional Government," for instance, but nothing about log-rolling and compromise as inevitable parts of the democratic process; to be able to discuss "Justice" and "The Judiciary" at length, but not to know about bailiffs and their relationship to judges. There is talk about ideas and about classes of ideas, without cognizance of the particulars for which they stand.

Relative to the aesthetic, intellectualiza-

tion is often taken as displacement of artistic works and of their appreciation by substituting abstract constructions which become the subjects of conversation. A reading of *Lear* seems to become only an occasion for discussion of "Tragedy" or "The Tragic," on the one hand, and for the construction of an "analysis," a kind of detailed but abstract blueprint, on the other. The concrete, particular drama and its unique artistic effect seem to be tossed aside.

These are, however, not the consequences of employment of the intellect, but a corruption of it by education which arises when reason is conceived as opposed to other constituent functions of the human psyche. Differentiation of the intellectual, active, and aesthetic has its place in philosophical analysis and as a heuristic ground for psychological research, but it is a dangerous doctrine for the liberal educator. It leads to an incomplete curriculum whose shortcomings can be defended only by the hopeful assertion that "life" (as opposed to "school") will supply enough and to spare of the active and the moving.

The doctrine arises from a misunderstanding of what it means to be human. But it is no mere empirical error, stemming from poor observation of human behavior. It is a large-scale error of conception, arising in biology and carrying over into logic, concerning the meaning and relation of genus and species and applied to the notion of man as generically animal and specifically rational. The error assumes that the generic and specific exist as separate, insulated, determining agencies in the organism, each having its appropriate effect on the finished product, but none upon each other. The specific is conceived as merely superimposed upon the generic. It is as if sodium chloride were conceived as an inclosing stuff within which a sodium atom has acted to produce some of the properties of the stuff, and a chlorine atom the remainder, rather than as an entity in itself arising from the interac-

tion and coexistence of its constitutive elements. At the least, genus is to species as matter is to form: the specific is a modifier and modulator of the generic. An isosceles triangle is not triangle *and* isosceles, but a figure whose triangularity is of a particular kind. Indeed, the relationship may go farther, to become one of mutual determination. In an adolescent gang not only does the adolescence of its members confer a special quality upon the "ganginess" of the organization, but, conversely, the gang organization modifies and specializes the attributes of adolescence in the persons so involved.

As an educational doctrine, the isolationist error is exemplified by the dictum (sponsored by at least two educators of note) that "the aim of man should be to destroy the mammal within us." It is assumed that the mammal dead can leave the man alive—and better. The suggestion is that man's specific rationality has simply been stacked upon his generic mammalinity and that, so situated, each competes with the other for man's time and energy. That either of these constitutive elements may dispossess the other is assumed. That the existence of each is contingent upon and coextensive with the other is not dreamed of. Yet this is the case. Man is no more rational *and* mammal than a snub nose is snub and nose. Snub is a modifier and modulator of nose. Reason is a modifier and modulator of mammalinity. A snub nose is a special kind of nose. A man is a special kind of mammal. Snub noses do not provide passage for air in quite the same way as do other kinds of noses, and human females suckle their young with concomitants and consequences not found in all other mammals. Man's actions and emotions are rife with reasonings (some good, some bad), just as his reasonings teem with consequences of his actions and emotions.

Education cannot, therefore, separate off the intellectual from feeling and action, whether in the interest of the one

or of the other. Training of the intellect must take place ("must" in the sense of "unavoidably") in a milieu of feelings and must express itself in actions, either symbolic or actual. We may employ the emotional and active factors existent in student and teacher as means for intensifying and facilitating the process of intellectual education—or ignore them and suffer at the least a loss of them as effective aids, and possibly an alienation which places them in active opposition to our purposes.

One sees precisely the latter consequence in many institutions. Because the emotional and active are considered as apart from the intellectual and of no concern to the teacher, practically all feeling and propensities toward action on the part of the student are attached to the extracurricular. The curriculum becomes a bore, an unpleasant duty, a necessary evil, and, consequently, the recipient only of energies left over from the more compelling activities of campus life. Thereupon, we the teachers develop the legend of wayward youth wherein only the exceptional or the sick young person has intellectual interest. By this myth we protect ourselves from a view of our failure as teachers.

The legend is a legend. *Sub specie aeternitatis*, the young are potentially capable of a vast and omnivorous appetite for learning, for deliberate as opposed to capricious action, and for aesthetic and creative experience. It is the legend, reflected to each generation of students by upperclassmen, by campus tradition, by the weary skepticism of some professors, and by cynical indulgences by clowns among the faculty, which the young, respectful of their elders, hear, accept as true, and try to realize, thus conferring upon the legend a semblance of reality.

This is a reversible trend. The findings of modern psychiatry and psychology amply evidence the merely local and cultural determination of normal campus youth toward indifference or distaste for

the intellectual. The same sciences join hands with older findings stemming from ethics and religious practice to give us a sense of the nature of the youthful person and of his potential proclivity for pursuit of solutions to problems, of consequential activity, and of aesthetic enjoyment. And with this sense, the educator of ordinary sensitivity, reasonable maturity, and a certain energy can reverse the trend, create the kind of social and emotional climate in which the intellectual, the deliberative, and the artistic potentialities of the young will receive a fair share of energy, interest, and affection.

Appetite, emotion, and reason, then, can be abstracted from one another for purposes of thought but not in action. If we are to act upon and with another human person, as in his education, these factors must be understood and employed in their interaction and interpenetration. The fact of their interpenetration is one of the starting points, one of the principles, for consideration of education whether in respect to ends or means.

Eros, the energy of wanting, is as much the energy source in the pursuit of truth as it is in the motion toward pleasure, friendship, fame, or power. Any means or method of education taps this energy source to the extent that the method is at all effective, and the best means of education will be one which taps it most effectively. (Though the best educational means must be measured against other criteria as well.)

Not only the means, however, but also the ends of liberal education involve the Eros. For the end includes not only knowledge gained but knowledge desired and knowledge sought. The outcome of a successful liberal curriculum is *actively* intelligent people. They *like* good pictures, good books, good music, good movies. They *find pleasure* in planning their active lives and carrying out the planned action. They hanker to make, to create, whether the object is knowledge mastered, art appreciated, or

actions patterned and directed. In short, a curriculum is not complete which does not move the Eros, as well as the mind of the young, from where it is to where it might better be.

Inquiry into the means of liberal education must then seek answers to two questions concerning the affective factor in education. To what objects does the youthful Eros readily attach? Which of these can be sufficiently ambiguous to serve not only in satisfaction of present needs but also to generate or bring to consciousness more enduring satisfactions?

To locate something in practice which fulfils these two conditions is to initiate the only practical means by which the Eros may be moved to more enduring objects. It is also to initiate and energize a highly efficient process by which the student may learn to discriminate these enduring objects from others, to master the arts or skills or methods necessary to their pursuit, and to digest the knowledge which bases these arts and skills. It is, in short, to initiate the climate in which liberal education can take place effectively.

II

The usable object of the youthful Eros as so defined can be described concretely. It is a nexus of four factors, constituting a situation. The situation so constituted is the initial phase of discussion as it functions in the liberal curriculum. The first and central factor of the situation is a certain face-to-face relation between teacher and student. The other three are enabling factors involving the administrative organization of the institution, the physical conditions of instruction, and certain characteristics of the curricular materials. These subsidiary factors are important in order to establish the face-to-face relation and in order that its effects may be channeled toward the envisaged outcomes of the curriculum.

The central factor is establishment of a distinctly interpersonal relation between the teacher and the members of a group of students, the effect of which, in the student, will be to evoke those propensities toward action which are conventionally known as liking and respect. It may be that for teachers who are consummate actors an interpersonal relation is not required. For such persons, it may be possible to determine the appearance and manner appropriate to evocation of liking and respect and to play the determined role so effectively that the student is moved to the desired response. It is my impression, however, that the best teachers, and the majority of teachers, cannot rely on a merely conscious and deliberate determination of manner and appearance. Rather, the manner and appearance which will evoke liking and respect in the student will arise only as the teacher does, in fact, respond to the persons before him. (It is the reciprocity of evocation and response which constitutes a genuine interpersonal relationship.)

If, in the first moments of the first meeting of a new class, the teacher's gaze wanders first to one, then to another and another of the anonymous faces before him, those faces which are not readable yet as to promise and performance, and if, in this wandering inspection, two or three students answer his regard in a way which signals to him their curious awareness of him as a person, a start has been made. The person who is thus aware of me is a person of whom I become aware. The wandering movement of my eyes is stopped. They return to him or her. (From an anonymous sea of faces, from the mere collective, individuation has begun; "the class" is beginning to be "persons.") The teacher thus answers the awareness he feels in the student; he examines more closely the person who has signaled interest in him. In reciprocity, this new inspection is no longer felt by the student as mere curious awareness, but as awareness of himself

as a person. More, the student feels his own movement from item to individuality, from anonymity to personality. And he is grateful.

For the Eros which appears in its most obvious guise as a hankering after externals is, in a deeper analysis, a regard for self, a desire for selfhood. To experience another's recognition of one's self is to receive reassurance of that self's existence. Such assurance initiates further growth of self. Gratitude follows.

But there is one more phase to the cycle which establishes our interpersonal relationship. The grateful warmth in the student is felt by the teacher. And for this, he in turn is grateful. At that instant, liking is born. His gratitude is not for the self's assurance which comes from recognition, for he has not suffered from anonymity in these moments. (There is only one of him, whereas the students are many.) Rather, he is grateful for that reassurance which arises from notice of usefulness, of neededness. In a sense, he is grateful for the student's gratitude, for the sign that he has been useful. It is a parallel of Descartes's *Cogito, ergo sum*. I have affected, therefore I am.

It may be objected that, if liking is contingent on this last phase of the cycle, liking and respect are incompatibles, that respect will be founded on the teacher's maturity and competence, and that maturity in the teacher disallows grateful response to an adolescent. One answer, I think, is that no man's self, however full his life, is ever so complete that this species of assurance is no longer welcome. It is true that maturity is partly measured by decreasing *need* for this kind of assurance and increased emphasis on the maturity of him who gives it, but not by decrease of its welcome. (That is why, with increasing maturity, self-love can emerge more and more serviceably as love for others. The teacher for whom the average-to-good student is too pejoratively adolescent to be regarded in this

light is not so much mature as ill perhaps, or immature, or in a hurry.)

Another and complementary answer is that the teacher is not being asked to like what is infantile in the student but what is adolescent in its accurate and least pejorative sense—what is *growing up*. It is the germinal maturity in the young—germinal maturity of Eros, germinal maturity of intelligence—which he evokes and to which he ought to respond. And this should not be shameful to any man.

This complex but nearly instantaneous transaction need not take place with every student, nor necessarily in the first moments of the class. In fact, were it attempted with most students and all at once, it would fail, by virtue of the fact that the young are as much aware as adults that not everybody is as much a person as everybody else. The automatic assumption of pea-in-pod equality leads to the false-hearty, or to broody-hen behavior, which the student will reject. Three or four genuine transactions are enough at the start. In successive meetings, as successive students respond by revealing one or another quality of individuality, it is to be honored in its own right, as the teacher feels it. Thus a further level of individuation is reached; not only are persons individuated from the amorphous “class,” but, of different individual qualities, each is honored in its own way and degree.

Respect arises out of liking when the teacher successfully traverses the strait road between the extremes suggested above. On one extreme he may be over-anxious and overstate a wish to respond or like; in this case, respect will be lost. On the other extreme, he may be too cold, or perhaps too impatient or pre-occupied, to note signals of invitation and response; in this case, some liking may be lost, for, once rejected, good students are cautious about trying again.

After the earliest establishment of interpersonal relations, almost every student will engage in an active, personal

test of the teacher's judgment. This can occur in a tremendous variety of ways, but the essence remains the same; it consists of presenting for possible approval behavior which is false (i.e., manufactured), qualities which are irrelevant to the real business of the moment, or behavior designed to disrupt or impede the felt intention of the instructor. These are to be understood by the teacher as *provocative*. They are designed to seduce him. Pretended eagerness, fake interest, manufactured questions, test the teacher's capacity to distinguish the real from the false. Disclosure of irrelevant or inappropriate virtues tests his maturity. If he has immature needs for warmth, for the disparate friendship (or admiration) of the young, for instance, he will respond despite the irrelevance of the virtues shown. The teacher who responds to the sexual attractiveness of a pretty girl earns a lively interest which is not liking or respect but a measure of contempt. Or imagine a student who learns of a chemist's interest in music, is himself an able musician, and in a discussion of a chemical problem manages to intrude the fact of his musical competence (e.g., by using a far-fetched analogy). The teacher who responds to this provocation has also earned contempt—and, in fact, to a greater degree than has a male teacher who responds to a girl. For sex is recognized as a powerful drive, difficult to control; love of music is not.

For the normal student engaged in provocative testing of a normal teacher, the range of behavior is likely to extend from the exhibition of irrelevant bits of knowledge and irrelevant capacities, no further than to insistence upon intruding into the discussion expressions of belief, opinion, and preference, and questions of meaning or application of the materials under discussion, which are tangential to the detectable main line of discussion, or beyond or beside the range of interest and comprehension of the group as a whole. The proper response to these “normal” provocations is a clear com-

munication to the student of the teacher's awareness of the questionable usefulness of the proffered contribution. This response is not always easy, for it must take a form which does not reject the student along with his offer. It should not reject him, in common justice, since he is not wholly aware of the meaning of his action, and its origin is not malice but need. It must not reject him, if the "erotic" aims of this phase of discussion are to be achieved, for a rebuff at this early stage will be interpreted as evidence of a specific weakness in the teacher, a self-doubt concerning his status as authority.

The simplest and most literal way of treating the offering without attacking the student is often the most effective. To a student's query concerning an esoteric application or source, "Ask that after class; it's a bit special"; to the expression of irrelevant opinion or fact, a patient waiting out of its statement and simple return to the business in hand without communication by facial expression or bodily poise of contempt, of impatience, or of patronizing patience. Or one can repeat what the student has said and indicate its connection with an aspect of the problem other than the aspect under discussion, in a way which does not blame him for its present irrelevance. (This must be done briefly, however, since to spend much time upon it will be to succumb to the student's seduction.) Too, one can simply ask the student's permission to postpone consideration of his point on grounds of the prevailing interest of the group or as a matter of personal privilege.

The evidence of thorough success in meeting these small crises lies in the student's subsequent behavior: in the first place, he continues to participate, but his contributions are fitting, and, in the second place, he "forgets" the invitation to reopen his tangential point or question. Only partial success, as indicated by continuing and fitting contributions accompanied by prompt presentation of the

teacher's promissory note, or no success at all, as indicated by continuing provocative behavior, may characterize one's efforts with particular students. There is no general remedy for this situation. In some cases the student will be satisfied by two or three further provocative tests met as the first one was. In a few cases he will never be satisfied, and his provocative behavior will become a regular feature of the class meetings which will not be changed even by expressed cognizance and dislike on the part of the remainder of the class.

Such cases are not necessarily failures on the part of the teacher—in the sense that had he done otherwise, the outcome would have been cure. In any student body there are some individuals for whom establishment of a working relation with what is to him an authority-figure is a task which rouses great anxiety. Such a young person cannot respond to *this* teacher, *this* class, *this* moment, for all these are bound up with past adults, past moments, and past relations, and his responses are to the unhappy mixture. Two possibilities exist for the improvement of such a young person. One is psychotherapy in the strictest and most exclusive sense. For this task, the teacher is both incompetent and irresponsible. The other lies simply in the student's discovery and repeated rediscovery of profit, of pleasure, and of the absence of injury in relationship with an adult. For this "therapy," the good teacher is pre-eminently qualified and responsible. His role and responsibility relative to it is to be a good teacher and a just and responsible person, and these he is, or should be. By so being, he constitutes himself a curative experience.

In addition to provocative behavior, the characteristic quality of which is inappropriateness, there is another kind of testing action which takes the form of an expressed eagerness to talk, to contribute to the discussions of the earliest class meetings, or in some other way to attract the attention of the teacher by means

which are at least superficially appropriate to the classroom situation. These are testing actions in a sense different from those which are provocative. "Appropriate" testing actions are designed to estimate primarily the psychological space, the degree and kind of tolerance which the student may expect from the teacher, rather than the teacher's capacity for appropriate judgment. To be recognized as awkward, to be caught in error, to be seen to misapply his intelligence or judgment is far more painful for the young person than for the mature adult. The young person's self is far from complete; his confidence in his individual existence is not great. He doubts not only his competence to cope with the real world but even whether he, as independent of controlling parents and copied manners and mores, does in fact exist. To the extent that successful and accepted actions give him the kind of reassurance that permits to him a new unit of self-growth, to the same extent failure and nonacceptance incite regression or postponement of new growth. These conditions of his self appear to the young person in the guise of a need to be assured that attempts at doing and thinking will be accepted as attempts, as trial runs and practices, and not as definitive measures of his powers or limitations.

The young student has not often had that reassurance in the teaching situation. The common run of instructors at the college level are unaware of this condition of the young, or indifferent to its magnitude, and consequently hold the student to the kind of responsibility toward words, toward choices and decisions, which is appropriate to adults. A surprising number of teachers go even further and employ instances of this non-responsible condition of the young student as occasions and excuse for a destructiveness toward the student's efforts which is wholly gratuitous in its intensity. Occasionally, an instructor will, through this destructiveness, reduce an entire class to silence in a matter of a

few weeks, and thereafter, of course, represent even more the students who now sit as silent witness to his aggression. Still other teachers, at the opposite extreme, frustrate the young student's attempts at intelligent activity by accepting any contribution whatever without estimate or critical comment, thus reducing the teaching relationship to a species of saccharine wet-nursing. In view of these altogether too common unsatisfactory experiences, many students feel compelled to discover the worst as soon as possible.

It is at this point in the initiation of relations within the group that one of the greatest losses of potential future participation may occur. The uncertain student who receives at this early moment a response to his testing which is "wrong" for him may not again open his mouth except under strong provocation of interest or welfare. The "right" response depends on a sensitive and charitable awareness of the peculiar helplessness, the vulnerability, which is conferred by the combined status of adolescent and student. The teacher must feel, or at the least be aware of, the conflict of impulses, part bravado, part appeal, part reckless plunge, part deeply insecure hesitancy, engendered by this vulnerable condition and must comprehend the *gaucherie* which will inform behavior arising from such a conflict of impulses. With this kind of empathy, the teacher's response is less likely to be "wrong," and a higher potential of teaching effectiveness for the group will be preserved.

This empathy and the sensitively measured response to student stimuli which is likely to flow from it cannot be replaced by a generalized receptivity, an uncalculated and wholesale acceptance of student offerings with a uniform kind and degree of "permissiveness." The student wants to be taught, not merely and unqualifiedly "accepted." He wants to be accepted as a learner, which means that the teacher must teach. He no more enjoys the transparently false pretense that he is complete than he enjoys attack be-

cause he is not complete. He wants neither syrupy friendship nor awful judgment but correction and assistance. These he can accept without anxiety from a person he likes and respects. He likes what is measuredly and discriminately kind; he respects what is unpretentiously able and competent.

"Testing" behavior, then, is designed to estimate the teacher's Eros for the student, his charity. Impeding and provocative behavior test the teacher's strength. If any person is to put himself in some way into the hands of another, he must have assurance both of his gentleness and of his strength and competence. This is no less true of student to teacher than of woman to man or friend to friend. Hence the testing and the seducing, provocative acts. The former are done in the hope that they will succeed. The latter are done in the hope that they will *not* succeed. If the first hope is betrayed, the student retires into passivity. If the second hope is betrayed, if the provocative acts succeed instead of fail, the person betrayed will take his revenge. This revenge is the origin of practically all teacher-student relations involving "disciplinary problems." Quite simply, the students find the teacher undeserving of respect, guilty of not being a man, and punish him for failing them.

There are then two pairs of pitfalls to be avoided by the teacher. One pair bounds the pathway which leads to recognition by individual students and by the teacher of each other as proper objects of Eros, their likable and respect-deserving individuality. The pitfalls for the teacher are coldness, on the one hand, and overanxiety to be liked, on the other. The second pair of pitfalls bounds the pathway which leads to that relationship between student and teacher which takes account of the Eros of the student for himself—his wavering uncertainty which arises from his incompleteness. The pitfalls are peremptory judgment, on the one hand, and indiscriminate permissiveness, on the other. Provocative behavior helps

to guide the teacher past the first set of pitfalls. "Testing" behavior helps guide him past the second. If these pitfalls are avoided, liking and respect will arise. These feelings come to be not serially, but concurrently, with a phase-lag of respect upon liking. Liking increases as more numerous interpersonal relations are established and as those made earliest ripen through recognition, acknowledgment, and tolerance of more and more of the individual traits in the persons involved. Respect ripens as the provocative testing process ensues upon liking and is satisfied. At the rate of three meetings per week, a normally heterogeneous group of approximately twenty-five in a well-planned curriculum and in the absence of spectacular external diversions (e.g., a climactic football game) will have completed this initial phase in the establishment of discussion at the sixth to the tenth meeting.

At this point, the teacher has in his hands a potent instrument for good influence or bad. As the next stage in the Eros aspect of discussion, he is now to use it to evoke in students a drive to emulate his professional activity and interest and a desire for his approbation. He is to convert liking and respect for his person into pleasure in practicing what he is and does as a liberally educated person. This is to say that, ultimately, the student's Eros is disengaged from the person of the teacher and fastened upon those qualities and capacities which make any man complete. The Eros, in this last state, is attached to the qualities and the capacities in their own right, and not as qualities and capacities of the teacher. The student learns to like them (through being brought, originally, to like their possessor) because they are good, to enjoy their exercise, and to desire them for himself. The student who remains attached to the teacher for long after their relation as student and teacher has ended has not been taught so much as he has been enslaved or used.

It is quite clear that the relationship

involved in liking and respect can be misused. It can be corrupted by an ignorant, a weak, or a neurotic teacher in many ways. The ignorant teacher may employ it as a powerful device of propaganda and indoctrination. The weak teacher may direct the Eros, not through himself to the objects of the curriculum, but upon himself. The seriously neurotic teacher may move in any one of many directions. He may engage in deliberate manipulation of a captive audience for the sake of a sense of power. Very often, he will be exhibitionistically preoccupied with evoking applause and admiration. He may use his students as objects of destructive aggression. He may even try to corrupt accessible members of the group to a state which fits his own neurotic symptoms.

But these possibilities do not constitute an argument against the use of affective interpersonal relations in education. The neurotic teacher will use them in any case. As for others, any device or means is capable of misuse, and a powerful means toward a good end is likely to be almost as potent in misuse as in a defensible function. The physician-patient relation is susceptible of a similar corruption. So is that of father and son. In the last analysis we must depend upon the integrity of the men *selected* for the task. The teacher-student relation, at any rate, is accessible to a control which cannot reach parent and physician: the rule of *Caveat administrator*.

Let us turn now to the conditions under which the interpersonal relation can best be established and employed—the administrative organization, the physical circumstances, and the curricular materials in and through which affectively energized discussion can take place. The administrative organization of the school becomes important because it may impose upon student and teacher relations which are inimical to the liking, respecting “friendship” which is to be developed. Physical circumstances intrude in so far as they impede or facilitate the

sometimes subtle, and often wordless, communications by which the relation is established and maintained. The curricular materials are obviously important, since they embody the purposes for which the relationship is established.

The father-child relation offers us an analogy to that of student and teacher which, in certain respects, can guide our examination of administration, physical conditions, and curriculum. By ordinary custom and institutional structure, the teacher, like the father, is taskmaster and inquisitor. He establishes the course or program, assigns and receives, probes and examines. At best, therefore, he is obeyed when it is convenient, evaded with all the ingenuity of which the intelligent adolescent is capable, is the recipient of masterly instances of dissembling and pretense. At worst, he is disliked or even hated. The teacher is also a source of material and emotional welfare. He is the giver or withholder of approval in the form of pass or fail, high grade or low. He must be cajoled. For on the passing grade the undergraduate is dependent for continuation of his student status—either through the institution’s rules or parental willingness. And on the better grade many an adolescent is dependent in the same way, though not in the same degree, as the child is dependent for emotional well-being on the approval of father and mother.

But the friendship relation of parent and child sets the model for the affection relationships of teacher and student. This rare relation comes into being when a series of transactions between child and adult have their origin and direction given by a task in which they are jointly engaged. If the task is “real,” that is, if it embodies creation of something admirable or useful to others, the experience involved becomes the most complete of which the young is capable. The feeling experienced can be atomized into a sense of the smooth flow of muscle and movement, a sense of increased stature (the child literally feels himself taller) and of

increased clarity and scope of vision, hearing, and touch. These sensations are felt as if they were a translation or representation of something occurring in deeper and more intrinsic levels of the child's personality. That "something" is growth of the person; the body translates this to consciousness.

The experience comes as a smooth flow of creative volition in which the makers, the object being made, and the materials and actions of its construction become one organic and unfolding whole. It is the experience for the child of the growth of its ego, of its capacity for Eros. It is felt with intensity when the several constituents of this growth of self are present unalloyed: the young ego with nascent potentialities; another ego, more complete, more capable; an object, something admirable to be made or done.

The elder ego functions as a catalyst and a bridge. As catalyst, it marshals the capabilities of the young ego. This catalytic power arises from union in the elder ego of factual and emotional accessibility as a model. It is factually a model if it owns powers possessable but not yet possessed by the child. It is emotionally accessible as a model if it has invited the child to be like itself. Because the invitation arises from an ego of superior capability, it has validity: the possibility of being "like" is guaranteed as possible. Because the invitation is to be like a superior person, the child's ego is recognized and complimented; it is assured, not merely of its existence, but of its capacity for increase. A second condition is required for emotional accessibility. There must be no demand upon the child other than participation, no insistence on right methods or standards which would change the child's view of its incompleteness from capacity for growth to mere incompetence.

Thus the elder ego can function as bridge, taking the child by one hand and the task of creation by the other.

Since it is an emotionally accessible model, its competence is not a threat to the child but a promise of aid; and the task, which is really beyond the immediate capabilities of the child alone, seems possible of achievement. Meanwhile, the competence of the elder ego guarantees to the child the worth of the selected task. Thus the child is persuaded to stretch, to extend itself, and so to assimilate to its actual capabilities its nascent potentialities.

These same elements are required in the relation of teacher and student (though their fusion is different). There is the young student with certain potentialities to be developed; there must be a teacher who can appear to the student as competent in the first place and as an ally—an emotionally accessible model—in the second; there must be a task whose end is admirable and whose difficulty is such as to challenge the capacity of the student and employ the competence of the teacher to such a degree that his participation with the student in the work to be done will not be mistaken for patronizing or contemptuous bending of giant to pygmy, of adult to child.

The systematic difference between the "friend" relation of parent to child and the analogous relation of teacher to student lies in the phrase "adult and child." In the case of parent and child, the parent is an adult, the child a child. The adult status of the parent can be recognized by the self-avowed child and received, not as an intimidation, but as a solace. The young student does not admit, however, to an inevitable and necessary childishness; consequently, he cannot accept mere adulthood on the part of the teacher as the equivalent of superiority. On the contrary, if he is to participate fully with an adult, it is at a price: he demands and must receive the right to judge the teacher and admit him, or not, to the role of adult, of teacher. (Otherwise, he will merely submit grudgingly to the pressure of institutionally

conferred authority and behave accordingly—at his whim, with evasion and pretense, with some profit but much friction, and with little pleasure in the tasks which accrue to him in the role of enforced recipient. Under such circumstances, the school will neither employ the Eros of the young student to further the ordinary purposes of education nor be able successfully to include among those purposes a development and organization of the Eros.)

Because of this new condition for emotional accessibility, the roles which are mere handicaps to the parent become much greater obstacles to the teacher. The roles of taskmaster and inquisitor, of giver and withholder of marks of progress and success, not only adulterate the quality of the experience of conjoint action to a desirable end but make it virtually impossible. If bread-and-butter love is called into being, the affection which will marshal capabilities and lead to intellectual and emotional growth is likely to find no support at all.

In the usual school organization, these undesirable roles are vested primarily in three transactions: the police work of "calling the roll," the examining function, and the vestiture of course-planning exclusively in the person of the individual teacher.

The first of these may appear trivial, and in some sense it is. But nowhere else in the teaching situation is the entire tone of proceedings set so definitely at the start, and so regularly, by an action which asserts to the student that he is a subject, subordinate to discipline and obedient to rules in whose formation he had no hand. It is questionable whether entirely voluntary attendance at all ages or years in the college program is the solution to this difficulty. Students come to different colleges at different mean ages and at even more variable levels of maturity and capacity for voluntary administration of their time. It would be desirable to move in this direction, nevertheless, as experimenta-

tion with particular student bodies indicates what degree of freedom is optimal. Several schemes are possible. Attendance may be required in the freshman year, or the first two years, and made voluntary thereafter. It may be required in the first year, made contingent on performance in the second, and voluntary thereafter. It might be required in the first few weeks of each semester or quarter and made voluntary after that. In any event, it is desirable that the police function be divorced from the teaching function and from its place as initiator of class work. To this end, the device of placing responsibility for check and enforcement of attendance upon the students themselves might be tried. Through student government or class organization, this alien and inimical duty might be removed from the teacher.

The handicap created by investing course-planning functions exclusively in the individual teacher is not obvious. (Neither is it as pervasive as the effect of the police function or as serious in effect as the examining function.) It arises because it puts the teacher in the position of inviting the student to participate in tasks which he and only he has set for them. The only reason the student has for accepting the invitation to participate in the work of the course is the reason of force, the power and status conferred on the teacher by his official position. It is an impressive sign of students' tolerance and charity toward teachers that they perform as well as they do on tasks they must take blindly and without reason.

This condition is most simply ameliorated institutionally by the device of a corporate staff or committee which is responsible (and known by the students to be responsible) for course-planning. Knowledge on the part of the student that such a committee is responsible for the planning of his work has two desirable effects. In the first place (and most important), it guarantees to the student that what he is asked to do has been

devised and decided by a meeting of minds, by discussion, by oppositions and compromises among different opinions of what is proper, and thus removes the structure of the course from his consciousness as a series of tasks imposed through the whim of a single individual. Second, it insures a divorce between the giver of tasks and the helper in the doing of tasks sufficiently to permit the teacher to exercise the latter function without handicap from the former.

It need not be argued, I suppose, that the common examination system of the American school is, in general, a vicious one, if the willing and independent quality of a student's work is of any concern to the teacher. The work cannot, by the farthest stretch of the word, be called willing when it is done perforce under the whip of an imminent inquisition. It cannot be called independent when it must meet a test arbitrarily set by the same man who sets the work. The custom of frequent examination will not be altered in our generation: the system is too firmly fixed in our school and social tradition. But the second of these conditions, the identity of teacher and examiner, has been removed in many institutions and can be removed in more if the teaching staff so desires. It is fair to say that ingenuity could not combine the inimical effects of bread-and-butter love and submission to the taskmaster and inquisitor more effectively than does the institution of the teacher-set examination. Without its removal, the possibility of establishing a sound teaching relation with the vast majority of students is well-nigh nil.

Experience has shown that the solution to this difficulty is as simple as the difficulty is great. It does not consist in the establishment of a wholly independent examining body. (Indeed, a wholly independent examining body is not desirable for many reasons.) It consists rather of the same device which can provide effective divorce of the planning and teaching functions—the device of a

corporate staff or committee. As in the case of course-planning, the student is satisfied by the existence of such an examining body that his examination is the product, not of whim but of community judgment. His own instructor can appear before him, not as inquisitor but as the source of aid which is required for conjoint action toward the aims of the program. The quality of this change is further enhanced if the examining function is exercised through the corporate staff or committee by a technical assistant, the Examiner, whose primary duty it is, but whose work is constantly checked as well as planned in conjunction with the staff.

Through these administrative shifts—the removal of the police function and divorce of the teaching function from planning and examining—the teacher is freed from the roles which handicap his function as a teacher. It remains to discuss briefly the physical conditions of discussion, and the materials of the curriculum through which the initial relation of liking and respect can be translated into that conjoint attack by teacher and student on a problem challenging to both, which is the epitome of the teaching relationship.

As trivial as the roll-call function, but also as important, is the fact that the worn tradition of teaching as dictation is embodied in a classroom structure and arrangement which virtually forbids students to see one another and requires them to look as steadfastly at the teacher as a subject is required to eye a hypnotist. Chairs are arranged in serried ranks. The students gaze at teacher or at the backs of one another's heads. To sneak a turn of the eye to right or left is to catch a glimpse of an evasive profile and to feel guilt at inattention to the authority at the front of the room. These are not the conditions under which casual conversation, much less serious discussion, can take place. "Face-to-face" communication is more than a metaphor. It is a description of the conditions under

which words and sentences whose purport is of the subject in hand, whether science or politics or literary criticism, is made to carry a second meaning, the emotionally laden communication by which a person signals to another his interest in and attitude toward that other person. It is the condition under which as empty a salutation as "Hello" can carry to a communicant the full sense of the speaker's good will, indifference, dislike, or resentment. Discussion, then, even to be discussion, much more to be affectively energized discussion, must take place face to face.

The most obvious means of achieving this condition is the arrangement of chairs in a rough oval. This results in a curious identification of bodily protection and ego-security. The seated person exposed to the gaze of others feels a peculiar sense of vulnerability, of nakedness, which inhibits free exchange of thoughts and feeling. If, however, the members of our potential group are placed around a table, the sense of vulnerability and its consequent hesitancy disappear. The cause seems to lie in the secrecy the table affords for movements of the hands, of the body, and of the legs as means by which each person is able to express for and to himself responsive feelings he is not prepared to communicate to his neighbors. Later, when the group has come to know one another, and when a number of relationships bind members of the group to one another, this cautionary device is no longer necessary, and discussion will occur freely under any circumstances in which the communicants can see one another's faces. An oval table, capable of seating twenty-five in comfort, seems to be the optimal equipment. Larger and smaller tables have been tried. The larger tends to create a sense of great distance and of psychological remoteness between those at the farthest points of the oval. Smaller tables are appropriate where the number in the class is smaller.

When classes are larger than twenty-five, the table which seats twenty-five is still appropriate. Chairs placed back of those at the table are then occupied by students who choose them. They are not improperly excluded from a sense of membership in the group by their second-row position. On the contrary, this second row provides a kind of psychological bay, a second line of defense, behind which those more timid than their fellows can test out the situation and participate in the way they find most comfortable with the least sense of compulsion and exposure. If interpersonal relations are successfully established, the event will be marked by the drift of some of the second-row occupants to the table, a drift for which room is often automatically made by the spontaneously friendly gesture on the part of other students of drawing their chairs away from the table so as to make room for the person who has now signaled his or her readiness to join fully in the group. It is a moving and important action.

If an affective situation which can serve the ends of a liberal education is to be established, the materials of the curriculum must be at least as fit for the purpose as the administrative and physical conditions of instruction. The earliest relationship established in the group is that of liking and respect for the teacher on the part of the student. This relationship is to go through many stages as part of the development and organization of the Eros. In its first condition, the Eros, thus organized, engenders a wish for the teacher's approbation. This approbation, the student is to discover, arises from his effective use of what powers he possesses upon the work in hand. Call this, if you will, Eros for the teacher. In the second stage, he is to discover, through the work which earns him his approbation, the greater pleasure in the experience of conjoint work with others. And the earliest phase of this is pleasure in conjoint work with

the instructor. Call this, if you will, Eros for the remembered experience of "friendship" with the parent. The pleasure so earned and the organization of the Eros which results prepare him to surmount the competitive feeling toward peers he originally experiences in the presence of the liked and respected elder ego and to try the experience of conjoint work with his peers. Ideally, the Eros is then shared with the objects of conjoint, creative action and, ultimately, in very rare instances, with the work of creation itself.

We are concerned here only with the first and second stages. If the movement from first to second stage is to take place, the possibility of real conjoint work with the instructor toward an admirable goal must be actual. For this purpose, it is necessary that some parts of the content of the curriculum be materials which offer as much challenge to the instructor as they do to the instructed, for otherwise there will be nothing in which the teacher may genuinely participate; there will only be opportunity for condescension and consequent increase rather than decrease of the psychological distance between student and teacher. In the case of music appreciation, for example, some of the works employed can be short, trivial, or vulgar, but attention to these materials must lead, at the last, to analysis of some works of sufficient stature and complexity to make clear to the student that the teacher and he are one in their recognition of the challenge and inexhaustible magnitude of the work. In the case of science teaching, some of the problems set for laboratory and discussion may be simple "exercises" invented and set by the teaching staff, or selected, simplified summaries of experimental work ("junior monographs"), but these must at last culminate in problems or reports of researches which bear the stamp of authenticity and which are clearly seen by the student to pose to the teacher as well as to him challeng-

ing problems of comprehension and understanding.

III

It is precisely these conditions which discussion in its liberally educative function is designed to fulfil. Discussion is, therefore, in one sense only a systematization, a conscious and controlled development, of what every good teacher tends to do and what he would want to do, had he only the appropriate climate in which to function and a curriculum which provided the necessary raw material of discussion—problems to be solved, dignified occasions for deliberation on policy and action, and unsentimental occasions for apprehension of works of art. He wants something more for his students than the capacity to give back to him a report of what he himself has said. He wants them to possess a knowledge or a skill in the same way that he possesses it, as a part of his best-beloved self. He does not want his teaching to be mere phonography, although the administrative structure of education often prevents his being more. He wants to convey not merely what he knows but how he knows it and how he values it. He wants to communicate some of the fire he feels, some of the Eros he possesses, for a valued object. Discussion in its liberally educative function has in it, then, a great deal of Mark Hopkins on one end of a log, but it is a Mark Hopkins with something *in his hand*, a Mark Hopkins with something to impart other than his mere self. His controlled and conscious purpose is to liberate, not to captivate, the student. The log is not his home.

Education can no more afford to separate the intellectual from the active and affective as objectives of the curriculum than it can separate them as means. The effect of a curriculum whose end was training of the intellect, pure and simple, would be a crippled intellect. It would be crippled intellect in the simplest possible sense—one largely

incapable of intelligent direction of actions and emotions, an engine without a load. The educated man is not one whose "life of the mind" is ordered while his emotions run hog-wild and his actions are aimless. Rather, the educated man is one who, while he enjoys a "life of the mind," also leads an active life in which zest and impulse restore, instead of exhausting, themselves by having aims given them by thought. Similarly, the educated man's response to music and works of other arts is not limited to evanescent nostalgias and maudlin feelings of power, self-pity, and Oceanic escape. Thanks to his mind, he appreciates the art work instead of depreciating it. Rather than reduce it to a mere springboard or occasion, he gives it, through his knowledgeable eye and ear, the power to affect him by all the ordered structure and meaningfulness which the artist put in it in the first place.

The "intellectual" arts and skills with which the liberal curriculum is concerned are not then intellectual as to subject matter, and thus exclusive of other subject matters, but intellectual as to quality. They are the arts and skills which confer cogency upon situations and actions whether these be scientific, social, or humanistic, general and abstract or particular and concrete. The liberal arts, however formulated, are to be understood as the best statement of our present knowledge of the human make, of the various means—some special in their application to specific subject matters, some general—by which the understanding frees us from submission to impressions, beliefs, and impulses, to give us critical and organizing power and deliberative command over choice and action. A liberal curriculum is one concerned that its students develop such powers.

With respect to ends as well as to means, then, the aim of a liberal education is not to "destroy the mammal within us." It is to harness Eros in the con-

trolling reins of reasonableness in order that we may borrow energy from her for intellectual purposes and, conversely, enjoy to the fullest the capacities for feeling and action she confers upon us. The liking and respect, the Eros, which the instructor moves to attach to himself as the initiation of discussion, has a function beyond the energizing of discussion and its attendant labors. This latter it must do, at the start and throughout the weeks of work. But Eros functions in the curriculum, not only as a means, but in its own right as well. An education becomes liberal only if the Eros is moved from one successive object to another until it comes at last to the objects of the curriculum.

If discussion is to achieve this purpose, it must do more than impart specific learnings. It must take cognizance of its "erotic" purpose *and* its intellectual aims, and it must take action in respect to them together. The movement of Eros and the movement of the mind cannot take place separately, converging only at the end. In the person, the student, they interact and interpenetrate. They must be treated so in transactions with a person. They must be moved together. Consequently, the quality of effective discussion will reflect this conjoint purpose.

The quality of discussion appropriate to this conjoint purpose can be stated as three functions which, ideally, every discussion, and every segment of discussion, will serve. (It is not practically possible, of course, that every query and every hour of discussion will serve equally well all three functions. It is enough if the three show a proper balance in the long run.) First, each query or discussion must serve as an efficient means of arriving at a specific, intended understanding of some specified object of knowledge. This is the function of discussion which is most commonly understood. Second, each query or discussion must function as an instance of movement toward understanding. It

must represent that kind of attack upon the problem at hand which would be found appropriate and proper, defensible as a part of the discipline of the field in question, by a master of that field. We are trying to impart, not only knowledge, but a species of activity ("method," if you will) as well. We are concerned that the knowledge we impart be sound. We must be equally concerned that the activity be sound; and the activity which matters in the teaching of it is not the "method" we talk about but the method we actually employ in the sight of our students and persuade our students to employ. Third, each query or discussion must function as a stimulus to the student to try the activity in question, the activity which can eventuate in the immediate understanding sought. It is this function which most obviously involves the Eros.

The three functions of discussion may be restated as three criteria by which the instructor may judge the efficacy of a proposed plan or query. He asks: (*a*) whether it is an efficient means of arriving at a specific, planned goal; (*b*) whether it is a defensible instance of movement toward that kind of understanding; (*c*) whether, in view of the bent and interests of his students, it is likely to rouse two or three of them so to move. We may call these, for convenience, the substantive, the exemplary, and the stimulative functions of discussion. Taken together, they represent the three conjoint categories of the aims of liberal education: knowledge, power, and affection.

It is important not only that these three functions be served by the long run of discussion but also that they be served in a proper balance. Yet the balanced functioning cannot be described, for it is a dynamic mean. It varies from group to group, from instructor to instructor, and from time to time in the course of discussion. The group of low energy or of scattered interests needs more of the stimulative, for example,

than of the exemplary and the substantive. A tense and anxious group, hounded by competition, by social or economic pressures, requires little of the stimulative. But it may need much of the substantive to assuage anxiety through concrete signals of achievement; and certainly it needs much of the exemplary, in order to mediate the headlong and uncritical rush toward the substantive which its anxiety motivates.

The teacher with a flair for insights and inspirations, whether about his subject matter or about the course of discussion, is one who must attend much more to the criterion of exemplariness than to the substantive and the stimulative. Conversely, the teacher in whom circumstance has created remoteness from the young needs to be most attentive to the problems of the stimulative.

With respect to the time factor also, the balance point is variable. For an average student group with a well-balanced teacher, for example, the stimulative will exceed the other functions, and the substantive will exceed the exemplary, early in the course of discussion. But soon thereafter the exemplary must be introduced more and more until it exceeds, first, the substantive and, later, the stimulative aspect of the situation. The mean or balance cannot, then, be given both a general and a precise formulation. The extremes, however, can; and in terms of these, the teacher may locate the mean for himself.

The tendency to plan a discussion as a dramatic dialogue with beginning, middle, and triumphant end epitomizes the tendency to bury the exemplary and stimulative functions of discussion under its role as means to a specified understanding. The end is reached in the allotted time, as a rule, and the student *seems* to move to and grasp the conception, theory, or view which the instructor had in mind. It will be found, however, that at best the student moves from one carefully fashioned query to the next one in much the way a woman in

high heels uses steppingstones across a brook; the far shore is arrived at with a sigh of relief. The goal is reached, but no cognitive map of the route persists in the mind of the student. In fact, the goal can be said to be reached only if it be taken as a decidedly illiberal one; that is, if it is a theory, a conception, view, or what-not which is to be accepted as authoritatively given rather than understood in terms of the argument, evidence, or usefulness which warrants it. For even if the elements of the dramatic dialogue are in fact exemplary of steps in the argument, deliberation, or treatment of evidence which warrants the end-point of the discussion, they will not be understood as such nor, in fact, understood at all. They will function simply as the stones which, having got one across the creek, are forgotten.

The exclusively exemplary discussion is as seductive under some circumstances as the dramatic tendency is in others, but it is not a temptation to which one is likely to succumb unawares. The consequences are too obviously an abandonment of discussion to pass unnoticed. The teacher assigns a reading. When the class reassembles, a brief period is given over to student questions. Then the teacher takes over. If the work is a scientific paper, he formulates the background of the problem, exhibits the principles of attack, analyzes the evidence presented, and shows the cogency of the conclusions drawn. In dealing with tragedy or the novel, the teacher sets forth the details of character, plot, and scene, exposes their beautiful appropriateness to one another, and exhibits in his own person the aesthetic pleasure evoked by the artistry his sensitivity and analytic powers have detected and disclosed.

Overemphasis on the exemplary function can occur in a different way. It may arise from the teacher's mistaking himself for the curriculum. He may treat himself as the object to be taught. In the

social sciences, for example, the teacher may make each class period a time for exhibition of himself as the Objective Social Scientist, superbly nonethnocentric, indeed with no center at all, sticking to The Facts, eschewing all mere Value-Judgments. Or he may prefer the role of Emancipated Soul, owing nothing to Class and Caste, or be the antithesis of the Assertive, Aggressive, and Competitive member of a Vertically Mobile Society.

The teacher who teaches himself is more than a joke. He points up the danger of pure Mark Hopkinsism, the educational theory which makes the "good" (i.e., "fascinating") teacher so much of an educational principle that nothing else matters much. The danger of this view rests, not in the occasional exaggerated spectacle of the one-eyed leading the blind, but in the fact that none of us is entirely two-eyed. No teacher constitutes in himself a liberal education. That is why it is desirable that we function as the agents of education, not as its subject matter. That is why, too, it is desirable that the content of the curriculum be the product of staffwork, arising out of debate and discussion, not of individual choice. That is also why it is desirable that the curriculum comprise, in part, materials not of our own making. What we produce, or what is produced by our equivalents in other institutions, can reflect only what we are and what our times make prominent. A liberal curriculum needs more than that. More is needed for our own continued education, for a check against presumption, and as additional sources for our students. The recent textbook and the homegrown syllabus are important, are practically indispensable, but are not sufficient. What is wanted, in addition, is materials outside of and, if possible, beyond ourselves. Such materials act to check the tendency in us, the teachers, to mistake our own incom-

plete learning for eternal wisdom. They enable the student to be not quite so blind to our one-eyedness.

In the case of overemphasis of the stimulative, there is a threefold mistaking of part for whole. The activity of Eros is mistaken for its organization and development. Powers of communication are confused with the larger set of powers involved in the objectives of liberal education. And that amount of knowledge which can be drawn from limited experience is mistaken for enlightenment. By omission of the substantive function, only the students' experience remains as a subject matter and as a ground of discussion. By omission of the exemplary, what little is available for subject matter is treated only by means of the limited terms and methods already familiar to the participants. The combined omission of both has as its consequence increase of a drug-addictive taste for talk itself. Discussion is corrupted into bull session.

The largely stimulative discussion becomes druglike in its fascination, but it reveals its hollowness after the fact. When one leaves a traditional bull session, reaction sets in. The sense of comradeship fades; disgust displaces one's former sense of special competence and strength; able thought and apt expression are seen as self-display. The similar hollowness of the overstimulative discussion does not reveal itself as readily because of the disparate status of student and instructor. The instructor may know that he has not taught, for nothing new has been constructed by him with and for the students. But he can believe that the students stand looking with new eyes at experiences they had formerly taken with only a portion of their signification. He assures himself that his possessing no new thing is because he was the midwife only. The students had the baby. In part, of course, he is right. The organization or reorganization of experience already possessed is an es-

sential part of a liberal education. It is the way one weaves the web which binds past experience and new capacities for experience, by which new terms, new "frames of reference" are moved from the status of a mere equation to that of a formula (a flexible one) with which real ingredients may be compounded into meaningful experience. It is the means by which, quite literally, theoretical knowledge may be realized. But its enlightenment is limited to the little knowledge and experience which the student already possesses. It is a gross corruption of Dewey's "growth is growing."

Omission of the exemplary and substantive components of discussion necessarily restrict discussion to the resources immediately accessible in the student group. Omission of a substantive component means restriction of the content of discussion to what the student already knows. Omission of an exemplary component means that what will be done to and with the subject matter by way of understanding and evaluation is confined within the means already at the disposition of the student. With regard to the Eros the exclusively stimulative discussion centers each student's attention on himself: *his* knowledge, powers, and opinions. Consequently, the effect is to confirm complacent self-love as the proper condition of the Eros.

The merely stimulative discussion is not only a privation of possible and desirable ends but becomes positively mis-educative. Its very virtues—reintegration of opinion and of experience—are distorted in character and consequence by its isolation from substantive and exemplary components. It tends to reinforce in the student the view that his particular store of knowledge and his particular habits of thought are to be defended in their status quo rather than enlarged and reordered. Since the prevailing climate of the stimulative discussion is one of debate and polemic, each participant

finds sanction and encouragement for defense of what is his own and for attack upon the opinions, organizations, and treatments of others. In such a climate, errors of fact, of logic, or of principle discovered in one's own position take on the character of weaknesses to be hidden from an enemy. Admission of them is equated to defeat. On the other side, devices of *ad hominem* appeal, ambiguity, and confusion which succeed in obscuring a cogent fact or treatment in an "opponent's" position take on the character of victory. They are things of which to be proud.

In two respects, then, the merely stimulative discussion becomes positively miseducative. First, intellectual growth is discouraged. The drive and energy which is constituted in any situation by the prevailing activity and the prevailing sanctions of a group is put squarely in opposition to intellectual growth. Such growth, consisting of the assimilation of new knowledge and new principles and their reintegration into the body of opinion previously held is made to appear, in the polemical context, loss of face. Second, organization and direction of the Eros is diverted. Such increase in rhetorical and expressive skill as accrues from the polemical exercise is corrupted from its potential character as a means for the clarification of opinion and knowledge, and therefore as means for initiating intellectual growth, into weapons in a battle for domination of one individual by another. What might have been a conjoint inquiry, engendering the satisfaction which comes from collaboration with others toward an admirable objective, is converted into an experience in the art of verbal warfare and into a taste of (and for) successful aggression.

Neglect of the substantive component is effectively built into the polemical situation. Even though opinions are challenged, they are challenged only in terms of their dissidence from other opinions held by other members of the

group, and judgment among the several opinions is rendered sophistically on the basis of the prevailing opinion of the closed group as a whole. The essential feature is closure. The group is taught to take itself as the measure of true and false, better and worse; by extension, each member of the group is taught by the experience of the polemic to take himself as a similar measure in other situations. An unrealistic valuation of common sense and common knowledge, which is already a prevailing attitude in our society, is reinforced and confirmed. Realization that common knowledge and common sense are the result, through education, of what was once special knowledge and special sense is obscured. That common knowledge and common sense can increase by assimilation of what is currently special knowledge and special sense is tacitly denied. Rather, they are placed in opposition, and "common sense" is given that peculiarly normative meaning in which it is set over against special knowledge as "good" sense opposed to the vagaries of some bizarre point of view.

The desirable alternative to this habit of self-measured judgment of self-held opinion is constituted of two factors. The first is the habitual recognition that common knowledge and common sense are to be supplemented and corrected by special knowledge and special sense when problems arise which are new and important. The second is the habit (coupled with the appropriate abilities) of searching out and evaluating sources of special knowledge and special sense concerning the problem in hand. By these means, we avoid disdain of the specialist tacit in the merely stimulative and polemical discussion, disdain which, in a polity and economy as complex as ours, is as fatal as passive submission to his dicta.

Inclusion of the exemplary in its critical function means the deliberate introduction into the curriculum of the

"confusion" of *differing* solutions to important problems, solutions differing in the terms and methods by which they interpret their data and differing in the data they conceive to be relevant and important to the problem. On such materials, the union of stimulative and exemplary components would be directed first to the *felt* recognition by the student that men of good will can arrive at different answers to problems because differences in terms, "frames of reference," and methods yield differing formulations of the problem, differing delimitations of the data relevant to the problem, and differing ways of extracting conclusions from the data. Discussion would then be directed toward identification of the prevailing "frames" and methods which characterize each field of knowledge and toward grasp of the emphases and omissions which characterize each set of "frames" and methods. Finally, discussion would be brought to bear upon practice of the arts by which the terms, "frames," and methods employed in a given work are identified and their effect upon the scope and quality of solution is estimated and understood.

This is a difficult undertaking. It involves on the part of us who are teachers assimilation of modes of analysis appropriate to materials in our subject fields which are not often a part of specialized, graduate training. It involves development of patient and effective techniques of discussion which are not the rule in most institutions. The rewards, however, are great. Neither disdain of the specialist and glorification of common sense, on the one hand, nor enslavement of the layman by the unexamined authority of the specialist, on the other, would come to characterize our students, but rather intelligent communication between layman and specialist, in which each recognized his need

for the other and was confidently aware of his own role and value to the society in which he participates. Between laymen, where common problems but differing views enforce transaction, the relation would tend to be one of a common enterprise, a pooling of conceptions of the problem and partnership in a search for solutions, with an eye to the quality of the ensuing action rather than to the possibilities for personal domination inherent in the situation.

When all three factors are present in discussion and the goal for the Eros is firmly set on attachment to conjoint work with others toward an admirable objective, there is a little-used classic term which describes the temper of this union. It is the contrary of "polemic": the word "irenic." Etymologically, the word is derived from Irene, the goddess of peace, who was the daughter of Zeus and Themis and half-sister to Prometheus. This ancestry tells us much more than does a definition. Irene's peace is not the peace implied by "conciliatory," the peace of sleep, of quietude, of the suppression of self, of the absence of strife because of the absence of life. Her peace is the peace of work, of activity, of doing and making made orderly and rewarding by its aim. Her father, Zeus, is the god of moral law and order. Her mother, Themis, is the goddess of the law and harmony of the physical universe. Irene's half-brother, Prometheus, is the giver to man of fire and of the arts. Irene, then, is the goddess of those activities of men which employ her brother's gifts in the search for knowledge and mastery of the laws of the universe; those activities with knowledge and creation as their goal which bring into being the Eros which embodies moral law; the activities which take place in and through the Eros and have its increase as their goal.
